**Purpose-** This paper highlighted the significance of various factors influencing the contribution of home economists or simply the homemakers (non working females) towards the 'Circular Economy'. The study was based on the empirical study conducted in Meerut City in western UP, India.

**Design/Methodology/Approach-** The paper employed the exploratory research design in the initial stage for identifying the influencing factors/variables and furthermore descriptive research design was used to analyse the primary data. The sample unit was the housewives/house makers (non working females) of Meerut City with sample size of 250 (valid responses). Tabulation, Cross Tabulation & Descriptive Statistics were utilized to describe the data and 'Correlation and Regression techniques' were used for compiling the results.

**Findings-** The findings ascertained that mostly house makers were in the age bracket of 26-35 years, post graduates with an income level of Rs. 40000/- pm who were significantly contributing towards 'Circular Economy'. This contribution had positive relationship with various relevant factors, out of which most significant were 'Resource saving initiatives', 'Avoiding Unnecessary use of Social Media' and Recycling of the Products'.

**Practical Implication-** The study was highly practical being 'Circular Economy' had been the most sought transformation in recent times and every social unit was responsible for the same. Homemakers were the key managers in terms of managing the whole house and they required more visibility and transparency for their fruitful efforts towards economy of the nation.

**Originality/Value-** The study was highly valuable because the entire world had been stepping towards the circular economy and the paper was original as it was based on primary data obtained from 250 (valid responses) of housewives of Meerut City.

**Keywords** – Circular Economy, Contribution, Homemakers, Non Working Females, Transformation. **Paper Type** – Research Paper

#### 1. INTRODUCTION

The 'Circular Economy' as the name suggests is comprised of two words circular and economy whereas circular denotes the 'unending life' and economy denotes the 'resource utilization system in most efficient and effective manner'. Collectively 'Circular Economy' emphasizes on the system which utilizes the resources in such a manner that there is consistent transformation of resources in various forms. The 'Circular Economy' relates to the reusability of the available resources so that there will be no wastage by any means. Hence 'Circular economy' is a basic responsibility of each and every process, job, manufacturing activity, operation, service etc being resources are

#### P-ISSN: 2204-1990; E-ISSN: 1323-6903

scarce in nature. The objectives of circular economy can be achieved through redesign, redevelopment, reuse, reengineer, research, rethink, regenerate, restore, rebuilt etc. Eventually, every social unit and element in any case directly or indirectly related to 'Circular Economy'. Even if these social units are not aware with technical terms, then also they have to or are contributing towards the 'Circular Economy'. House makers (Non working females) have prominent role as far as contribution towards the same is concerned being they are responsible for the management of entire house in all respects. They are highly conscious towards the dimensions of circular economy and influencing it directly and indirectly. The basic research questions are as follows:

- What are the significant factors which influence the contribution of homemakers in circular economy?
- What is the impact of these influencing factors in overall contribution?
- What is the relation among these factors?

Hence to answer these questions, an empirical assessment has been done in Meerut city of 'Uttar Pradesh, India' by conducting the survey of house makers ((Non working females). Meerut city in western UP is one of the most prominent economic, social, educational and financial hubs. It is the part of NCR (National Capital Region) and with the advent of 'Metro and Rapid Rail', the trade and industrial development is expected to take roundabout metamorphosis. Therefore selecting the Meerut City as a part of study is highly justified for this domain.

# 2. LITERATURE REVIEW

Though extensive literature and past studies were available for 'Circular Economy' but they were mainly confined to manufacturing industries and production hubs. So for the specific objectives of the study, the data was significantly obtained from OECD library for secondary aspect and obtaining key variables. Finally, the following conceptual model had derived as a part of the study:

#### Fig.1 Conceptual Framework of the Study

3. RESEARCH OBJECTIVES

• To diagnose the various factors influencing the contribution of homemakers (non working females) towards circular economy in Meerut City.

• To demonstrate the relationship among various factors influencing the contribution of homemakers (non working females) towards circular economy in Meerut City.

- To ascertain the most significant influencing factors contributing towards 'Circular Economy'.
  - 4. METHODS AND MATERIALS ; In the first stage, the secondary data related to circular economy and its study with reference to the households and homemakers (non working females) was explored with the help of websites and specifically the OECD library. Around ten factors were identified which influence the contribution of respondents towards circular economy and further they were subjected to empirical assessment. Apart from these ten factors, demographic factors like age, education and family income of the respondents were also considered. Structured questionnaire was designed and respondents were contacted physically (to increase the response rate) through the selected BBA students of DVSGI, Meerut for obtaining the responses. These BBA students were provided thorough training for the same. Sample size was 300 out of which 250 valid responses were considered. The method applied for sampling is convenience sampling. The intensity of the selected factors were rated by the respondents with the assistance of 5 point likert's scale (1- Strongly Disagree (SD), 2- Disagree (D), 3- Can't Say (CS), 4- Agree (A), 5- Strongly Agree(SA)). Reliability analysis was not conducted scientifically but pilot testing was conducted with 25 personally known housewives and the questionnaire was changed accordingly. Complete data was collected in one month and entered in excel sheet with a proper coding with the help of the selected BBA students only. Consequently with the assistance of SPSS tabulation, cross tabulation & descriptive statistics were performed to present the data .Correlation and Multiple Regression techniques were applied for reaching out to specific results. Key research (influencing) variables with their description and measurement scale used in the study were as follows (Table 1):

| Table 1 | Table 1: Research Variables |  |                        |  |  |  |  |
|---------|-----------------------------|--|------------------------|--|--|--|--|
| S. No   | Name                        | Description  | Measurement Scale used |  |  |  |  |

| 14      | Use_Natural                 | Maximum use of natural ingredients                   | Interval               |  |  |  |  |

Source: Author's own tabulation on the basis of Secondary data for fulfilling the research objectives.

It was clear from the above Table1 that the first three variables (age, education and income) were related to demographic factors and rests were the key study factors. However, the variable named as 'Contribution' was a

dependent factor and all other were the independent ones. As stated above, questions were asked in a statement form like 'I significantly contribute to 'Circular Economy', I recycle the all sorts of products, and I minimize the overall wastage' etc.

# 5.DATA ANALYSIS & INTERPRETATION

This data analysis and interpretation part has been divided into two parts as 'Tabulation of all variables' & 'Descriptive Statistics of all variables'. The collective interpretation is provided at the end of this section.

#### **5.1.1 Age of the Respondents:**

| Table 2: Age of the Respondents |                |           |            |                     |                          |  |  |

P-ISSN: 2204-1990; E-ISSN: 1323-6903

**Interpretation:** It is clear from Tables 2-15 and Table 16, that mostly home makers are in the age bracket of 25-35 years, post graduates and with income level of around 40000/- pm. Mean values for all the key study variables are 3.8 to 4.3 which strongly indicates that all the respondents were agree that they contribute significantly to 'Circular Economy'.

- 6 **RESULTS AND DISCUSSIONS** Results along with key findings are obtained by using the inferential statistics tools like Cross Tabulation (Overall contribution to 'Circular Economy' with Demographic Factors), Regression and Correlation Analysis.
- 6.1 Cross Tabulations Overall Contribution to 'Circular Economy' with Age of the Respondents:

| Table 17: Overall Contribution towards 'Circular Economy' to Age of the |       |            |             |       |       |       |  |  |  |  |

**Results & Discussions:** It is obvious from Tables 17 to19 that maximum respondents who have agreed for contribution towards 'Circular Economy' are in the age bracket of 26-35 years, post graduates and income level is around Rs. 40000/- pm. They are more concerned on savings and keen on agreement on the factors relevant to 'Circular Economy'.

Pearson Correlation (PC) coefficient is calculated to view the significance of relation between 'Overall Contributions towards Circular Economy' and all others factors and data is presented in Table 19:

P-ISSN: 2204-1990; E-ISSN: 1323-6903

Source: SPSS output on the basis of primary data.

**Results and Discussions:** The correlation coefficients from above Table 19 indicate the positive correlation between all the variables to 'Overall Contribution towards Circular Economy', however the most the most significant relationship is between 'Avoid Unnecessary use of Social Media', 'Recycling the Products' and, 'Resource Savings Initiatives' being p value is less than .005.

# 6.5 Regression Summary:

Though the 'Pearson Correlation' has demonstrated the vital results but as a progression, 'Regression Analysis ( Method is used 'Enter', Dependent variable is 'Overall Contribution towards Circular Economy' and Independent variables are Maximum use of Natural Ingredients, Purchasing Organic Foods, Creating Social Awareness, Fuel Efficient Cooking, Energy Efficient Transport, Kitchen/Terrace Garden, Avoid Unnecessary use of Social Media, Resource Saving Initiatives, Recycling the Products, Minimize the Overall Wastage) through SPSS is conducted and composed of following four self explanatory tables as Table 6.5.1 to Table 6.5.2:

#### 6.5.1 Model Summary:

Source: SPSS output on the basis of primary data.

**Results and Discussions:** It is evident from Table 6.5.3, that all the variables are positively influencing the 'Overall Contribution towards Circular Economy'. However the most significant variables are 'Resource Saving Initiatives' and 'Avoid Unnecessary use of Social Media' being the p value is .000.

#### 7. CONCLUSION

The current study states that management of 'Circular Economy' is not just related to manufacturing industries or the production powerhouses only rather is the concern of individual unit or the citizen which lead to integrate in a bigger landscape and larger phenomenon. In Indian culture housewives are the real house managers and their responsibilities are not less than any of the corporate manager. They significantly contribute towards the 'Circular Economy' through their household activities. They undertake various resource saving (electricity, water etc) initiatives and avoid unnecessary use of social media significantly to contribute for the same. Furthermore they strategize for recycling of the products as much as possible.

#### 8. LIMITATIONS AND SCOPE FOR FUTURE RESEARCH

The study has undergone certain limitations as availability of highly comprehensive and extensive pool of literature related to 'Circular Economy' which was highly impossible to cover in such a short span of research time. Furthermore, convenience sampling method with small sample and reluctant & hesitant attitude of respondents while providing responses had provided an obstacle for this study. Hence, it could be stated here that there is an

#### P-ISSN: 2204-1990; E-ISSN: 1323-6903

immense scope for future research in this domain being 'Circular Economy' was predicted as the most prominent transformation. This research study could be conducted with increasing the sample size and in other cities of India.
